

Aligned Fast-LeWM CEM on RK3588

One replan: S=300, 30 CEM iterations, then 25 open-loop actions

Measured latency per replan (one 25-action plan)

Amortized ms/action = replan latency / 25; it is not per-action feedback latency. Both paths use the official 6x32 action encoder and 16x64 predictor.
